Website Specifications

The website I am proposing is for Paradise Adventures Safaris. The main purpose of this website is to promote the business online to possible users around the world and show customers information about the experiences we offer. It will also make it easier for customers to contact the company and ask about bookings or other things the user may need to know.

The goals of this website are to advertise the company to attract more customers and show the different safari activities available. The website should help both local and international tourists learn more about the business and the experiences it offers no matter where they are.

The target audience for the website is tourists, local travellers, and people who enjoy nature and adventure. It is mainly aimed at adults of all genders, between the ages of 18 and 70. Some users may be from Botswana on holiday, while others may be international visitors who are interested in the safari of Botswana.

The users are expected to have basic computer and smartphone skills so the website will be maid with that in mind. Most of our target should be able to open the website, move from one page to another and read the information without difficulty because of this, the website should be simple, clear and easy to use. There will be a part for disabled customers to specify their issue and how they will be assisted by staff.

Information Architecture

The website will have a Home page, which will be the first page users see. This page will introduce the company and give a short summary of the company and its services.

Next will be an About Us page. This page will give more information about the company, its background, and what it does.

Another important page will be the Services page. This page will show the safari activities offered by the business such as Mokoro Excursion, Bird Viewing, Boat Cruise, Game Drive, Scenic Flight and Camping.

The website will also have a Gallery page where users can view pictures related to safari activities, wildlife, and destinations.

Lastly there will be a Contact or Booking page where users can find the phone numbers, email address, physical address and send enquiries.

The website navigation will be simple and easy to follow. A menu will appear on each page so that users can move from one section to another without confusion. For example, a user can go from the Home page to the Services page and then to the Contact page if they want to ask for more information or make a booking.

Taxonomy

The content will be grouped into the following categories:

Company Information
The business name, background and general details about Paradise Adventures Safaris.

Services
All the safari activities offered, such as Mokoro Excursion, Bird Viewing, Boat Cruise, Game Drive, Scenic Flight and Camping.

Images and Media
This includes gallery pictures of wildlife, nature and safari experiences.

Contact Information
Phone numbers, email address, physical address, booking or enquiry details.

Technical Brief

- **HTML5**
  This will be used to create the structure of the website, such as the home page, about page, services page, gallery page and contact page. The markup hidden from the user.
- **CSS3**
  For styling the website and control the layout, colours, fonts and spacing.

- **JavaScript**
  To add simple interactivity to the website, especially on the contact or feedback form. It also will be used to check if the user filled in all required fields.
- **Bootstrap**
  To help make the website responsive so that it works well on phones, tablets and computers.
- **Visual Studio Code (VS Code)**
  VS Code as the main code editor for writing and editing the HTML, CSS and JavaScript files. It makes coding easier and helps organise the project files.
- **GitHub and GitHub Pages**
  To store the website files and keep track of the work while GitHub Pages will be used to publish the website online.
- **Web Browsers**
  Browsers like Google Chrome, Microsoft Edge, Opera and Safari will be used to test the website and make sure it displays properly on different browsers.
